

"Be the first to know - watch Loogie.net"

«**Loogie.net**» presents the results of individual queries as if they were ongoing and up-to-date news messages.

The automated news magazine consists of two autonomously functioning parts:

«Loogie.net News», a news magazine in the Internet (www.loogie.net) and

«Loogie.net TV», an interactive television program which can be shown as an installation or broadcasted by a TV organization.

«Loogie.net» is highly unusual in that it offers news messages and TV broadcasts compiled solely by computer algorithms without human intervention.

«**Loogie.net News**» is a personalized real-time online news magazine.

With Loogie.net an article can be arranged to your own discretion and you can infiltrate it with your own input. Thus words can be replaced in articles: Whether you let the pope beatify your favorite pop star instead of mother Theresa or you offering yourself to work as a negotiator for Palestine, it is open to you. The text will not only be read out and sent away - it will also remain stored and be indexed by Google e.g. and in such a way it will misinform and confuse other users.

Website: <http://www.loogie.net>

«**Loogie.net TV**» shows you the latest world news about the subjects you choose. By putting in keywords with a special remote control or by SMS you can determine which subjects will be shown on television and you will be presented with news fit to your specifications. Additionally, in a second step your TV program can be narrowed down and focused on your own main areas of interest. The content of the broadcast is searched in real-time on the internet and is seamlessly transitioned by the Loogie.net software.

Abstract

"Be the first to know - watch Loogie.net" «Loogie.net News» is a personalized real-time online news magazine. It presents the results of individual queries as if they were ongoing and up-to-date news messages.

With Loogie.net an article can be arranged to your own discretion and you can infiltrate it with your own input. Thus words can be replaced in articles: Whether you let the pope beatify your favorite pop star instead of mother Theresa or you offering yourself to work as a negotiator for Palestine, it is open to you. The text will not only be read out and sent away - it will also remain stored and be indexed by Google e.g. and in such a way it will misinform and confuse other users.

«Loogie.net News» is highly unusual in that it offers news messages compiled solely by computer algorithms without human intervention.

Annette Schindler, [plug.in] Forum for New Media, Basil, 11.11.2003

Loogie.net News is a personalized real-time online news magazine: the user chooses a keyword and within seconds receives a tailor-made cutting-edge News program. In a hip, but reliable design, using the proven interaction structures of well-known news agencies, the news articles arrange themselves by headlines, leads and contents, audiovisual material, and links to related news.

Loogie.net uses common search engines to search for texts, pictures and videos related to the desired subject. The results are saved in a database, analyzed by a text classification system and then ranked according to meaningfulness. The program establishes terms related to the subject and only the data marked as relevant by a computer algorithm will be used and automatically put together to form a news Page. Thus the Loogie.net news will not be produced by people, but by computer generated reporters or respectively by intelligent software. They are, therefore, not subject to screening by party-opinion or special interests, but instead to the selection of the

machine, feeding on the more democratic but also arbitrary information pool of the Internet. Since the artist delegates the power of choice back to the machine, he throws an ambivalent as well as critical glance at the unabated apparent belief in the technology of our society.

Users can let their personalized news be read to them by online-newscasters, print out the whole story, forward it per e-mail or give the “reporter” feedback on the text in the form of an evaluation and commentary. Finally, the user can get right into the contents by replacing words: For a more generally positive tone “bad” can be replaced with “not so good”, or going even farther “George W. Bush” replaced with “Britney Spears” and make the pop-icon a world power.

The claims („Loogie.net is the most trusted organization in the world.“ „We Report - You Decide!“ „When News breaks - Loogie.net is there.“) are derived from the copy-paste principle as well as the staff - an army of editors and reporters, supervisors and subordinates from every country with a name and portrait: Here also, the artist holds up a mirror to the need for self-portrait and the hierarchal structure of the media as well as to everyone who accepts these mechanisms without scrutinizing them.

The arguably most subversive part of the work is, however, the fashion in which they use the functionality of the Internet and make it useful: Every news report is linked and archived. This rapidly growing archive will be perpetually indexed by search engines. Since so many new pages will be coming in daily, the importance of Loogie.net news sites will consequently increase. This results in a higher ranking and the probability steadily increases that when surfing for news, using a search engine, you end up at a loogie.net generated site instead of well-known news site. Such “found” sites can cause confusion because the misinformation which they contain contrasts with that of the biggies, and the latter can also be thereby exposed.

The screenshot shows a web browser window titled "loogie.net News". The address bar displays "http://www.loogie.net/index_de.html". The website header features the "loogie.net NEWS" logo and the tagline "We Report You Decide.". Below the header is a navigation bar with links for "TOP STORY", "WORLD", "BUSINESS", "SCITECH", "SPORTS", "ENTERTAINMENT", and "Deutsch". A search bar is also present, showing a search time of 4.0992 seconds.

The main article is titled "Crowd Kills British Soldier in Iraq". It is updated on November 4, 2003, at 00:01 CET, and is by Judy Richardson for loogie.net News. The article includes links to "SPEAK THIS STORY", "EMAIL THIS STORY", and "PRINTER FRIENDLY".

More Infos About "Irak"

BAGHDAD, Iraq — Gunmen opened fire with small arms and rocket-propelled grenades on a British convoy trapped between two angry crowds in southern Iraq, killing one soldier and wounding another, the British military said Thursday.

The soldiers were returning from a raid when about 30 people blocked their route in the town of Ali as-Sharqi on Wednesday night, **British Lt. Cmdr. Richard Walters** said.

The soldiers moved around that crowd, only to be stopped by a second group of people blocking the road near **Fort Jennings**, he said.

The soldiers got down from their vehicles and fired two warning shots to disperse the crowds when the Iraqis attacked, killing one soldier and wounding the second in the hand, he said.

withdrew to their base at al-Amarah, 75 miles north of **Basra** with protection from helicopters and additional rapid reaction troops called to the scene, he said.

Abstract:

"Be the first to know - watch Loogie.net" «Loogie.net TV» shows you the latest world news about the subjects you choose. By putting in keywords with a special remote control or by SMS you can determine which subjects will be shown on television and you will be presented with news fit to your specifications. Additionally, in a second step your TV program can be narrowed down and focused on your own main areas of interest. The content of the broadcast is searched in real-time on the internet and is seamlessly transitioned by the Loogie.net software.

«Loogie.net TV» is highly unusual in that it offers broadcasts compiled solely by computer algorithms without human intervention.

The information about a subject found on the rich archives of the Internet vary in perspectives and editorial approaches. It may lead to some occasionally unusual and contradictory statements. It is exactly this variety that makes Loogie.net TV a valuable source of information on the issues you have chosen and tries to satisfy the wants and needs of the TV viewer even better than before.

Laudatio of the "tpc creaTVty award 2003" from Martin Roth

Imagine for a moment that you are sitting in front of the television and instead of choosing a channel, you choose a topic. National Council elections, starvation or beauty queens, for example. You enter these or any other keywords with the remote control into Loogie.net TV and promptly your personal news show begins.

Are we witnessing the much hailed birth of interactive television here? Probably not, since what you are experiencing with Loogie.net TV can be described more closely as "interpassivity" than interactivity. Marc Lee's work, therefore, fits in more closely with the habits of today's viewers than the media hyped interactive TV.

So what happens with Loogie.net TV? The contents (text, pictures, videos) defined by the keywords will be searched for on the Internet in real time and then coalesced by the custom made software. Familiar faces from CNN and other news channels appear on the screen and, in a monotone digital voice, present the findings from the Internet. In other words, the Internet contents are shoved into the mouths of TV stars. What they announce wavers between coherence, variety, and arbitrariness: In this way, Loogie.net certainly imitates well known news shows while at the same time caricaturing them.

The jury was convinced of Loogie.net TV for many different reasons. The project is fundamental research, media satire and art installation, all at the same time. Not only does it descriptively and exemplarily convey how complex contents can be processed in a user-friendly and software-controlled fashion, it also reflects the visions and limits of our information society in an intelligent manner. It was an easy choice to present Marc Lee the CreaTVty Award for New Media. We are dealing with an exponent of that scene of young designers and developers who, in a radical way, exhaust the possibilities of the Internet. As such, they extend the discussion of the new media much like video art did in the late 80's. Thus Loogie.net TV stands trendsetting and exemplary for new areas of study at our schools of Art and Design.

Exhibition Scenarios:

The exhibition consists of a television (sitting on a pedestal or table), which is suited to the room as well as the context of the exhibition. In addition, there are an appropriate and comfortable place to sit, possibly a sofa or beanbag chair, and a Loogie.net Butler (special remote control).

Diploma exhibition "Heimapparat", New Media, Gallery Binz 39, Zürich, June 27 - July 10, 2003

Loogie.net Butler:

Exhibition "CODE Campus", Ars Electronica, September 6-11, 2003

Loogie.net TV on air:

Loogie.net TV was daily on air during the media art festival transmediale04 (<http://www.transmediale.de>) on the TV station OKB (Offener Kanal Berlin <http://www.okb.de>). The TV viewers could send keywords by SMS and determine which subjects will be shown on the OKB television station.
